

ZUNGU — Claude Code Handoff

From: Claude (claude.ai chat session)

To: Claude Code agent

Date: March 17, 2026

INSTRUCTION

Discard the current build entirely. Do not salvage any existing files.

Start fresh using the single source-of-truth file described below.

THE FILE

The canonical version of the Zungu portal is a single self-contained HTML file.

Filename: zungu-portal-full.html **Size:** ~319KB / ~1,566 lines **MD5:**

1d9992b5affb60bb6231de95cdc6ebd9

This file is available as a download from the claude.ai chat session that produced it. The user will need to download it from the outputs panel and place it in the project root, or you can fetch it if the user provides the path.

WHAT THE FILE IS

A fully self-contained single-page application with no external dependencies except Google Fonts. No framework. No build step. Opens directly in a browser.

It contains:

Pages (JS-routed, no page reloads)

Page ID	Description
page-landing	Hero — Navy Island aerial, gold Z logo, two CTA buttons
page-signin	Auth — split panel, role-aware (investor vs partner)
page-redirect	Loading state — 2.2s animation then routes to portal
page-investor	6-tab investor portal
page-partner	5-tab partner portal

Investor tabs

1. **Home** — Jamaica manifesto, key stats, 5 open gates
2. **Brand & Concept** — festival positioning, 3 things nobody else has
3. **Stages** — expandable accordion cards for all 4 zones
4. **Activities** — 6 programme cards
5. **Marketing** — story arc, audience, media targets
6. **Budget & Investment** — full cost table, tiered pricing, revenue model

Partner tabs

1. **Home** — island-first pitch, what partners get
2. **Brand & Concept** — commissioning model
3. **Stages** — stage overview
4. **Activities** — partnership touchpoints per activity
5. **Confirm Interest** — selectable interest types + contact form

JS functions

`showPage , goSignin , switchRole , updateSigninPanel , handleSignin , investorTab , partnerTab , toggleStage , selectInterest , submitCTA`

DESIGN SYSTEM

```
--bg:      #04080A    /* near-black */
--green:   #0D2018    /* deep forest green */
--gold:    #C8A84B    /* signature amber gold */
--teal:    #4AAFA0    /* partner accent */
--cream:   #F2EBD9    /* warm white */
--muted:   rgba(242,235,217,0.4)
```

Fonts: Unbounded (900/700/300) + Space Mono — loaded from Google Fonts

Logo: Gold Z mark (transparent PNG) — base64 embedded

Hero image: Port Antonio aerial — base64 embedded

Cursor: crosshair

Border radius: 0px everywhere — sharp edges only

Grain overlay: SVG feTurbulence fixed to body

KEY DECISIONS ALREADY MADE — DO NOT CHANGE

- **Capacity: 2,000 tickets.** One authoritative number. Not “2,000–2,500”, not “capacity”. Tickets sold.
 - **Dates: June 17–23, 2027. 7 days, 6 nights.**
 - **Tiered pricing:** GA \$350–450 / VIP \$600–800 / Glamping \$1,200–1,800
 - **Island lease: ~\$44K** (7 days at ~1M JMD/day)
 - **Stage peak crowds:** Origins ~800 / Zungu Main ~1,200 / Rebirth ~500 — all within the 2,000 ticket base
 - **Glamping is a ticket tier, not separate headcount** — same model as Tomorrowland Dreamville
 - **No “cultural movement” framing.** The island is the pitch. Jamaica’s sonic history is context, not the argument.
 - **Investor accent: gold. Partner accent: teal.** Sign-in panel switches dynamically.
-

WHAT TO BUILD NEXT

The user wants this running as a proper Next.js application with real Clerk authentication.

Structure

```

app/
  page.js                ← Landing (currently page-landing)
  sign-in/
    page.js              ← Auth (currently page-signin)
  deck/
    page.js              ← Investor portal (currently page-investor)
  partner/
    page.js              ← Partner portal (currently page-partner)
  middleware.js          ← Role-based protection
  public/
    logo-z.png           ← Extract from HTML base64
    hero-port-antonio.jpg ← Extract from HTML base64

```

Auth logic

- Clerk handles authentication
- After sign-in, read `user.publicMetadata.role`
- `role: "investor" → routes to /deck`
- `role: "partner" → routes to /partner`
- Middleware blocks cross-access (investor can't reach /partner, partner can't reach /deck)
- Sign-in page reads `?role=investor` or `?role=partner` from URL params to set panel context

Clerk appearance variables

```

{
  colorPrimary: '#C8A84B',          // gold for investor
  colorBackground: 'transparent',
  colorText: '#F2EBD9',
  colorInputBackground: 'rgba(4,8,10,0.95)',
  fontFamily: 'Space Mono, monospace',
  borderRadius: '0px',
}
// For partner, swap colorPrimary to '#4AAFA0'

```

To extract embedded assets from the HTML

```

# Extract logo (search for logo img src, copy base64, decode)

```

```
python3 -c "
import re, base64
with open('zungu-portal-full.html') as f:
    html = f.read()
# Logo is in: <img src=\"data:image/png;base64,...\" class=\"hero-logo\"
match = re.search(r'class=\"hero-logo\"[>]*src=\"data:image/png;base64, ([^\"]+)\
if not match:
    match = re.search(r'src=\"data:image/png;base64, ([^\"]+)\">*class=\"hero-l
if not match:
    match = re.search(r'class=\"nav-logo\"[>]*src=\"data:image/png;base64, ([^\"]
with open('public/logo-z.png', 'wb') as f:
    f.write(base64.b64decode(match.group(1)))
print('Logo extracted')
"

# Extract hero image
python3 -c "
import re, base64
with open('zungu-portal-full.html') as f:
    html = f.read()
match = re.search(r'background-image:\s*url\(\'data:image/jpeg;base64, ([^\']+)\')'
with open('public/hero-port-antonio.jpg', 'wb') as f:
    f.write(base64.b64decode(match.group(1)))
print('Hero extracted')
"
```

CONVERSATION CONTEXT

This portal was built across a long session covering:

- Brand strategy for Zungu Festival 2027
- Navy Island, Port Antonio, Jamaica
- 2,000 ticket holders, June 17–23, 2027
- Electronic music festival — new entrant, island as the pitch
- Investors routed to brand strategy + financial model
- Partners routed to operational deck + CTA form

The full brand strategy document (`zungu-brand-strategy.html`) also exists as a separate 2,300-line file and contains: Leaflet.js maps, master schedule (15-month timeline), financial triggers table, stage placement maps, and the full operational plan.

IMMEDIATE NEXT STEP FOR CLAUDE CODE

1. Confirm the user has placed `zungu-portal-full.html` in the project root
2. Run: `python3 -c "import re; html=open('zungu-portal-full.html').read(); print('OK' if 'submitCTA' in html and '2,000' in html else 'WRONG FILE')"` to verify it's the right file
3. Ask the user whether they want: (a) static HTML served as-is, (b) Next.js conversion, or (c) Webflow/Framer export
4. Proceed accordingly
